ALEJANDRO SERRANO FERNÁNDEZ

LAB SESSION 4

STATEMENT

A metallurgical company needs your help! There has been an incident and the database files have been mixed up.

They need the steel's sheet ASAP! And they know you have the necessary capacities for it!

The company has given you a comma separated values file with all the data mixed in it, they say the data they need have the following structure:

Element1,Element2,Tolerance

An explanation of every field is detailed next:

1. Element 1: is a real number in the range between 0 and 2 both included.
2. Element 2: is a real number in the range between -1 and 2, both included.
3. Tolerance: is an integer number between 1 and 4.

The company needs you to perform the following task:

Task 1: Design a Regular Expression (as defined in theory lectures) to check the entries of their databases, in order to discover the right ones. Define the alphabet of the language represented by the RE.

E1 = 0+1;
E2 = 2
E3 = -1 + 2
E4 = 1 + 2 + 3 + 4 (Tolerance)
E5 = 1 + 2 + 3 + 4 + 5 + 6 + 7 + 8 + 9
E6 = 0 + 1 + -0

ELEMENT 1 = (E1, E5⁺) + (E2)
ELEMENT 2 = (E6,E5⁺) + (E3)
TOLERANCE = E4

RESULTING REGULAR EXPRESION:

$((E1, E5^+) + (E2)) , ((E6,E5^+) + (E3)) , E4$

FIRST ELEMENT ε -NFA:

COMPLETE ε -NFA:

Task 3: Get the minimum DFA equivalent to the designed ϵ -NFA

First we copy the ε -NFA in the table:

Note: All white spaces are \emptyset states

[illegible]

[illegible]

Second, we compute all $CL(Q)$

$>Q_0$	$Q_0, Q_1, q_2, q_3, q_{13}$
$CL(Q_1)$	Q_1, q_2, q_3
$CL(Q_2)$	Q_2
$CL(Q_3)$	Q_3
$CL(Q_4)$	Q_4, q_6, q_7

Now let's construct the obtained DFA in JFLAP:

For a better understanding, i will eliminate those transitions to dead states.

Finally we will minimize the DFA, with the following algorithm:

1. Build a table with all pairs of states
2. Mark all pairs of distinguishable states
 1. Mark those pairs with
 - One final state
 - One non-final state
 2. Mark those pairs $[q, r]$ if
 - $\exists a / [\delta(q, a), \delta(r, a)]$ is marked
 3. Go to 2 until no more marks are possible
3. All unmarked pairs represent equivalent states – Remove equivalent states

Equivalent States:

- Q4 and Q5
- Q19, Q25 and Q21
- Q36 and Q34
- Q41, Q47, Q45 and Q43

All aparitions of Q5 is called Q4
 All aparitions of Q25 and Q21 is called Q9
 All aparitions of Q36 is called Q34
 All aparitions of Q47 and Q45 is called Q41

Minimized DFA:

Also the company has detected that some steels that include number 25 in their decimal numbers can cause some danger so they need to identify these entries.

Task 4: Design a minimum DFA that accepts database entries, correct or not, where the decimal part of the element 1 has the number 25 in it.

Task 5: Combine the DFAs designed in tasks 3 and 4 with the product automaton method to find a DFA that accepts only correct entries in which the element1 has number 25 in its decimals.

For the automata product, I will use Excel to be able to combine them more easily.

Once the table is obtained, I will start with the initial state, in our case Q_0t_0 , since Q_0 is the initial state of our first automaton and t_0 is the initial state of our second automaton.

Well, in order to minimize the automated product as much as possible, I will only put those states that I find along the way (starting by Q_0t_0 , our initial state). To minimize it even more, I will take those states that contains the dead state t_5 or $?$ as a single dead state $?$

For example, Q_0t_0 has transitions to Q_4 , Q_{14} and $?$, So we will put those transitions and so on until no new state is found, just like the algorithm that converts NFA to DFA.

[illegible]

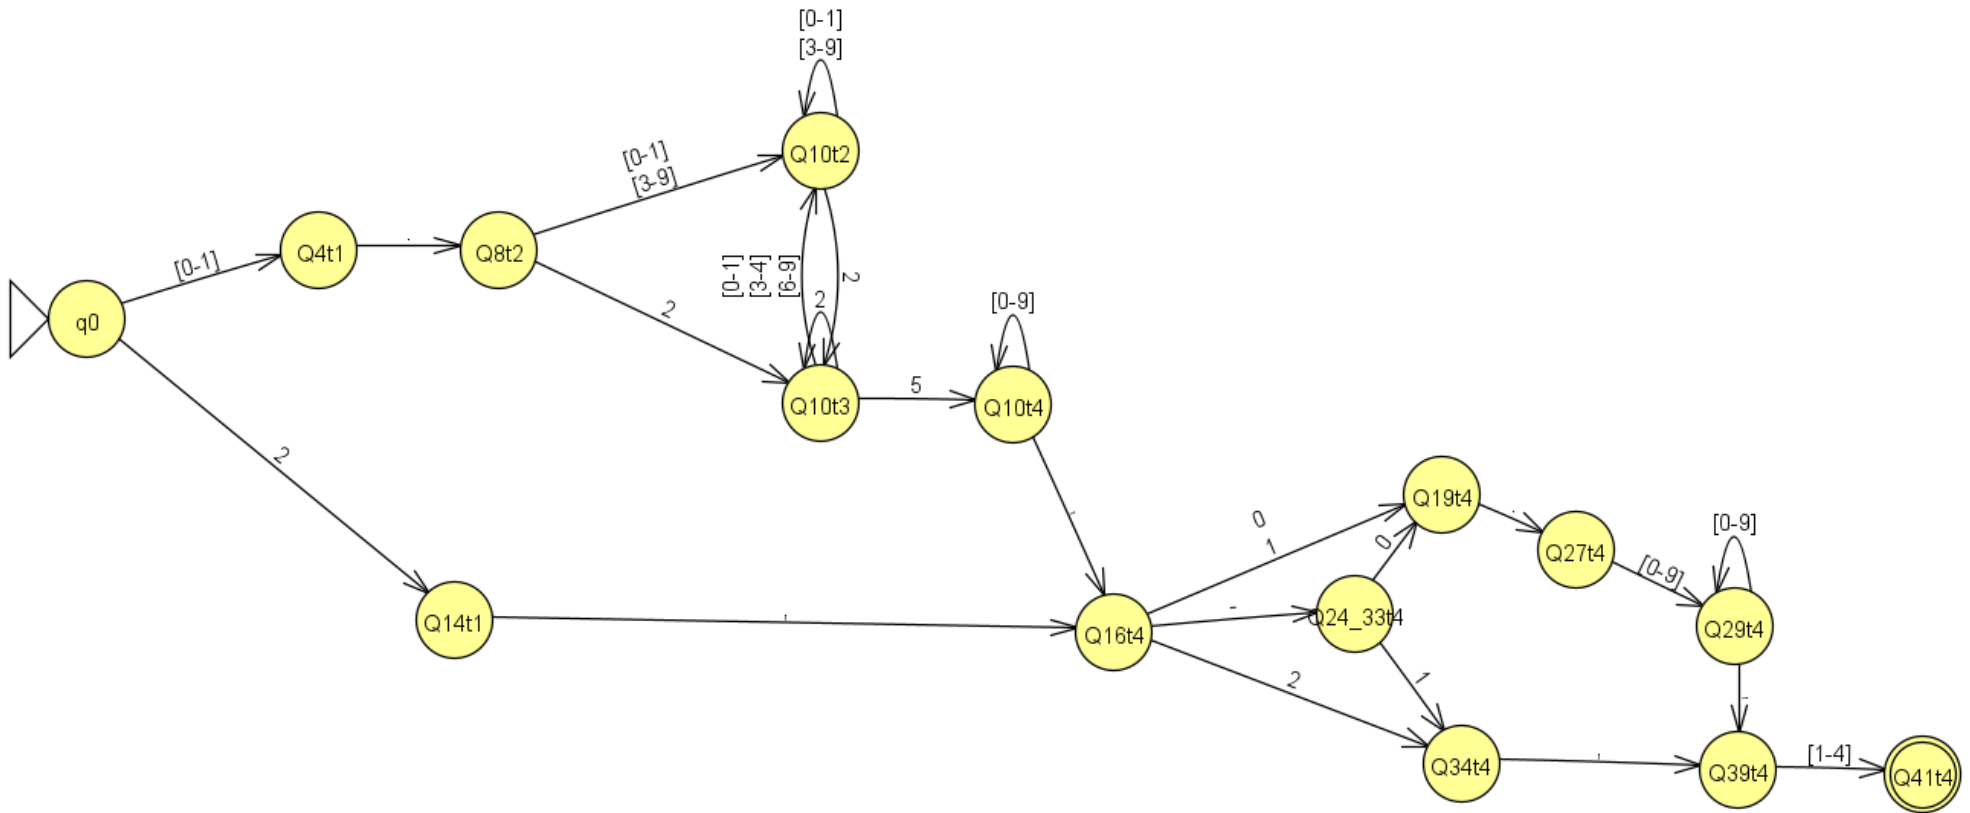

Once the states we are crossing have been obtained, we obtain the following table, which corresponds to the minimized product automata.

[illegible]

Product DFA:

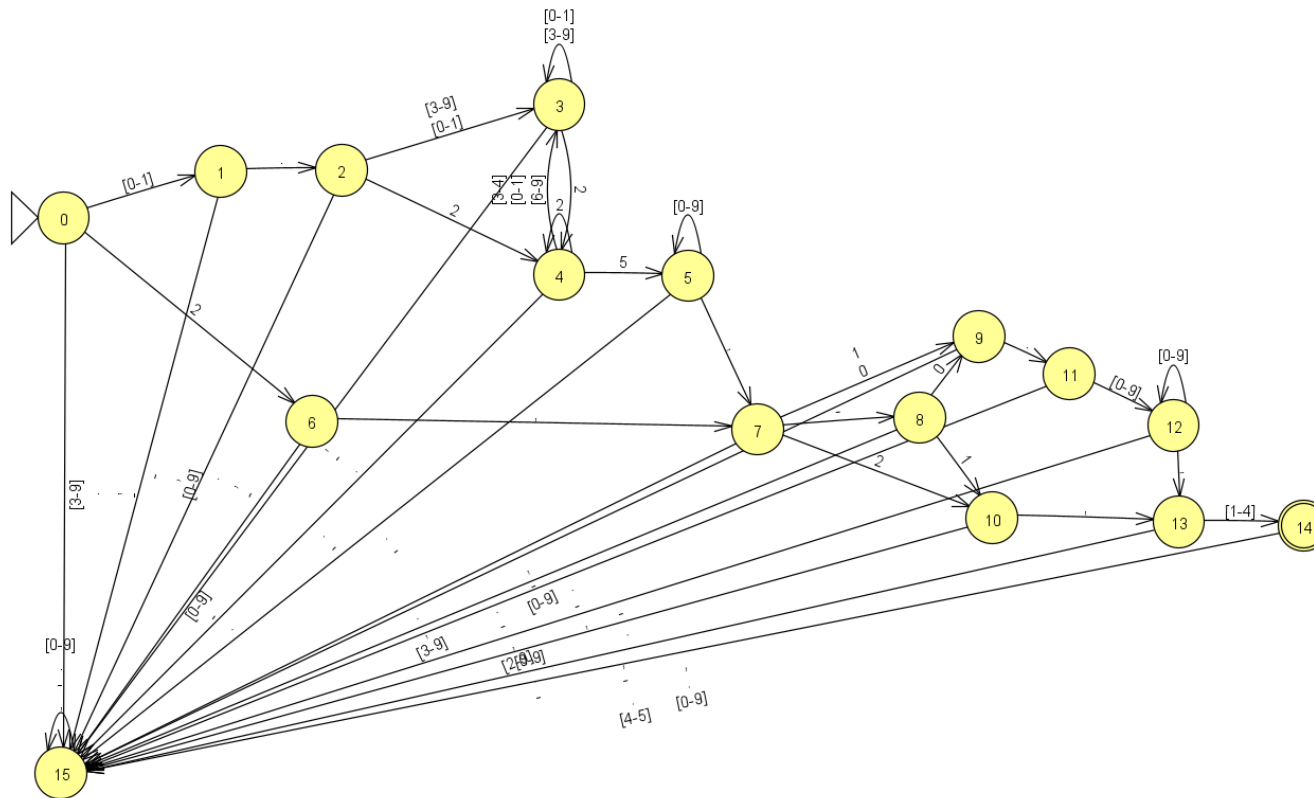

For a better understanding, i will eliminate those transitions to dead states.

Task 6: Implement in your favorite language the obtained DFA using the table method. The program must read a file with the database and print the correct entries where the element1 has the number 25 in its decimal part.

Note: The states have been renamed, as follows to better code it. The code is written in java language.

```
private int[][] G={
    // 0 1 2 3 4 5 6 7 8 9 , . -
    /*0*/ {1,1,6,15,15,15,15,15,15,15,15,15,15,15,15},
    /*1*/ {15,15,15,15,15,15,15,15,15,15,15,15,2,15},
    /*2*/ {3,3,4,3,3,3,3,3,3,3,15,15,15},
    /*3*/ {3,3,4,3,3,3,3,3,3,3,15,15,15},
    /*4*/ {3,3,4,3,3,5,3,3,3,3,15,15,15},
    /*5*/ {5,5,5,5,5,5,5,5,5,7,15,15},
    /*6*/ {15,15,15,15,15,15,15,15,15,15,7,15,15},
    /*7*/ {9,9,10,15,15,15,15,15,15,15,15,8},
    /*8*/ {9,10,15,15,15,15,15,15,15,15,15,15},
    /*9*/ {15,15,15,15,15,15,15,15,15,15,11,15},
